

## 1. PPP Method and PP-KS method

Table 1 False Alarm Rate in Correct One-Factor CFA Model

	K =6			K=12		
	N=50	N=500	N=2000	N=50	N=500	N=2000
KS0.3	0.3813	0.4247	0.2793	0.2589	0.3608	0.2408
PPP0.1	0.2140	0.2013	0.1113	0.1027	0.1332	0.0647
KS0.5	0.1967	0.1720	0.0953	0.0908	0.1050	0.0491
PPP0.05	0.1667	0.1193	0.0660	0.0679	0.0636	0.0277

Table 2 Detection Rate for Local Misfit in Underspecified Two-factor CFA model

	K = 12		K=24	
	N=50	N=500	N=50	N=500
KS0.3	0.3577	0.5539	0.3764	0.5791
PPP0.1	0.1748	0.3782	0.1698	0.3917
KS0.5	0.1609	0.3459	0.1509	0.3603
PPP0.05	0.1250	0.2967	0.1042	0.3105

$$KS0.3 = \frac{\sum_{i=1}^C \sum_{r=1}^R (\rho_{ir} > 0.3)}{CR}$$

where  $i$  is the item pair and  $r$  is the repetition.  $\rho_{ir}$  is the predictive posterior KS test for correct model with saturated model for  $I$  item pair correlation in  $r$  iteration.

$$PPP0.05 = \frac{\sum_{i=1}^C \sum_{r=1}^R (P_{ir} > 0.95 \cup P_{ir} < 0.05)}{CR}$$

Where  $P_{ir}$  is the predictive posterior percentile for  $i$  item pair correlation in  $r$  iteration.

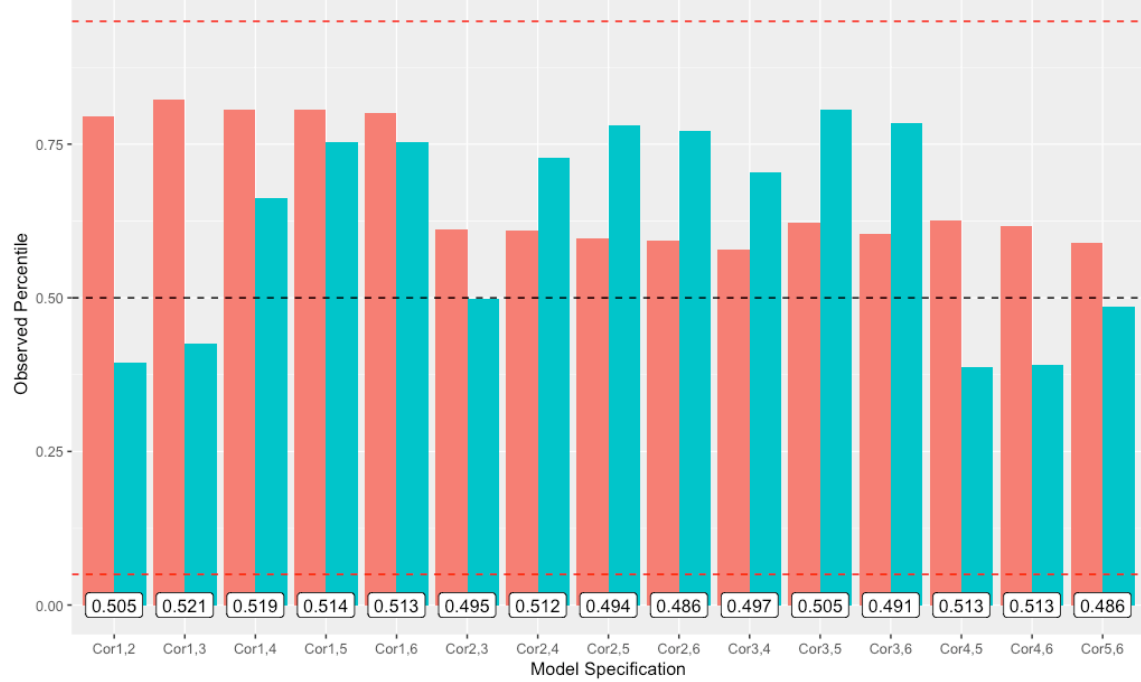

### 1.1 False Alarm Rate for Different cut scores

Correct one-factor CFA with N = 500, 12-item test

## 1.2 Correct One-factor (6 items) Model vs. overspecified Model

Both Posterior predictive KS test and p-value method were not able to detect the local misfit.

## 1.2 Correct 2-factor (12 items) test vs. underspecified one-factor model

For correct 2-factor (12 items) test vs. underspecified one-factor model, ppmc p-values was not able to detect local misfit.

PPMC KS test in Bayesian Framework could detect some local misfit in underspecified with N = 50. For example, the KS means for correlation between item 1 with 5, 1 with 6, 1 with 5 in underspecified one-factor are much higher than those in correct 2-factor model.

Maximum-Likelihood based p-values do not enough power to detect local misfit for underspecified model with  $N = 50$ .

### 1.3 Correct 2 factor (12-item test) vs. 2-factor cross-loading model

PP KS mean could detect the local misfit of the correlation item 1 with other items. PPP method don't have power to reject H0 hypothesis.

## 2. Large Sample Size with different types of misspecification

### KS-plot for 2-factor (12-item test, N = 500)

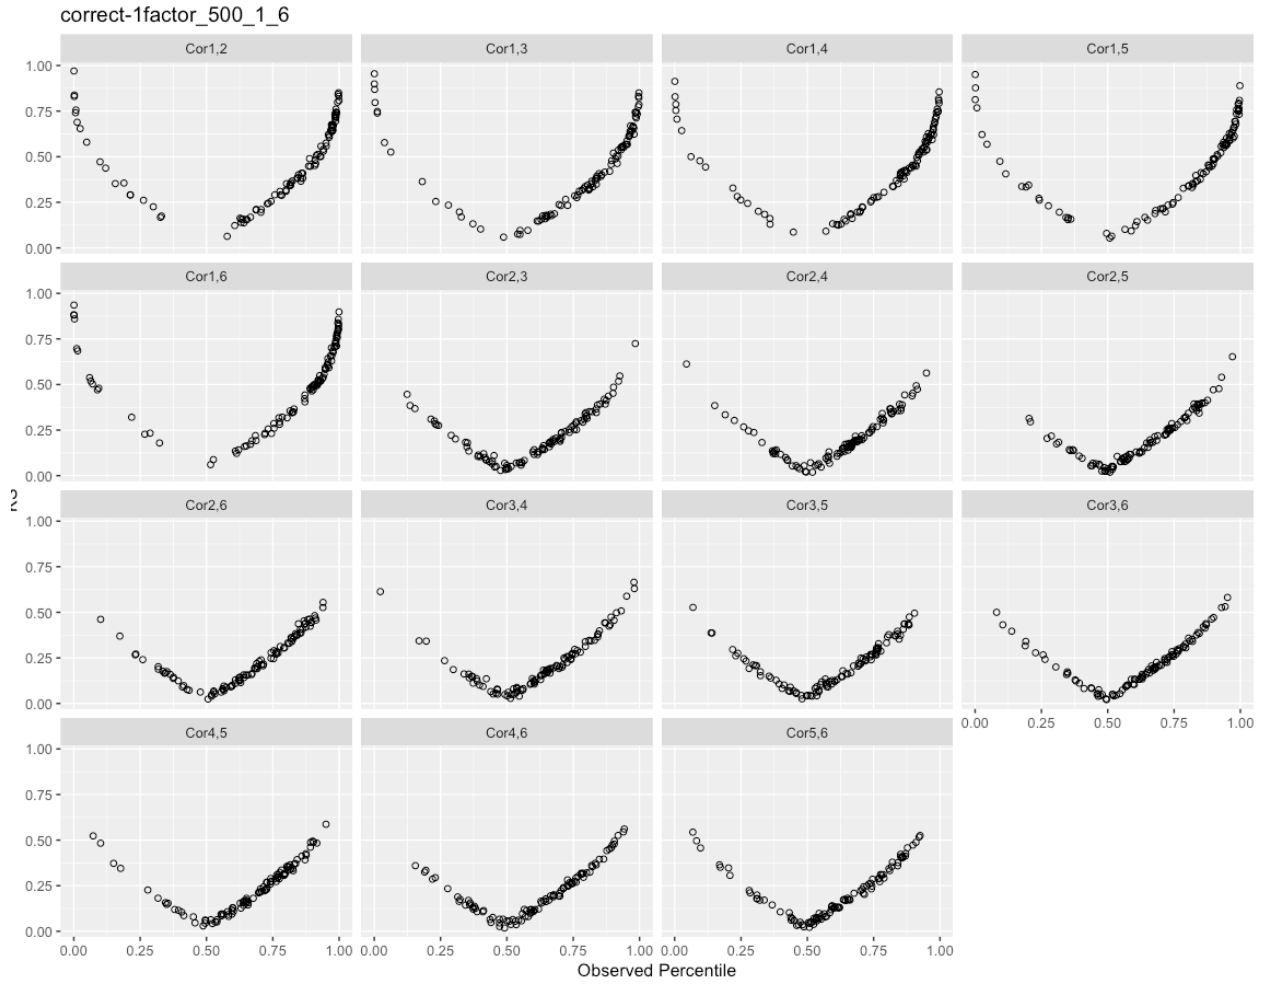

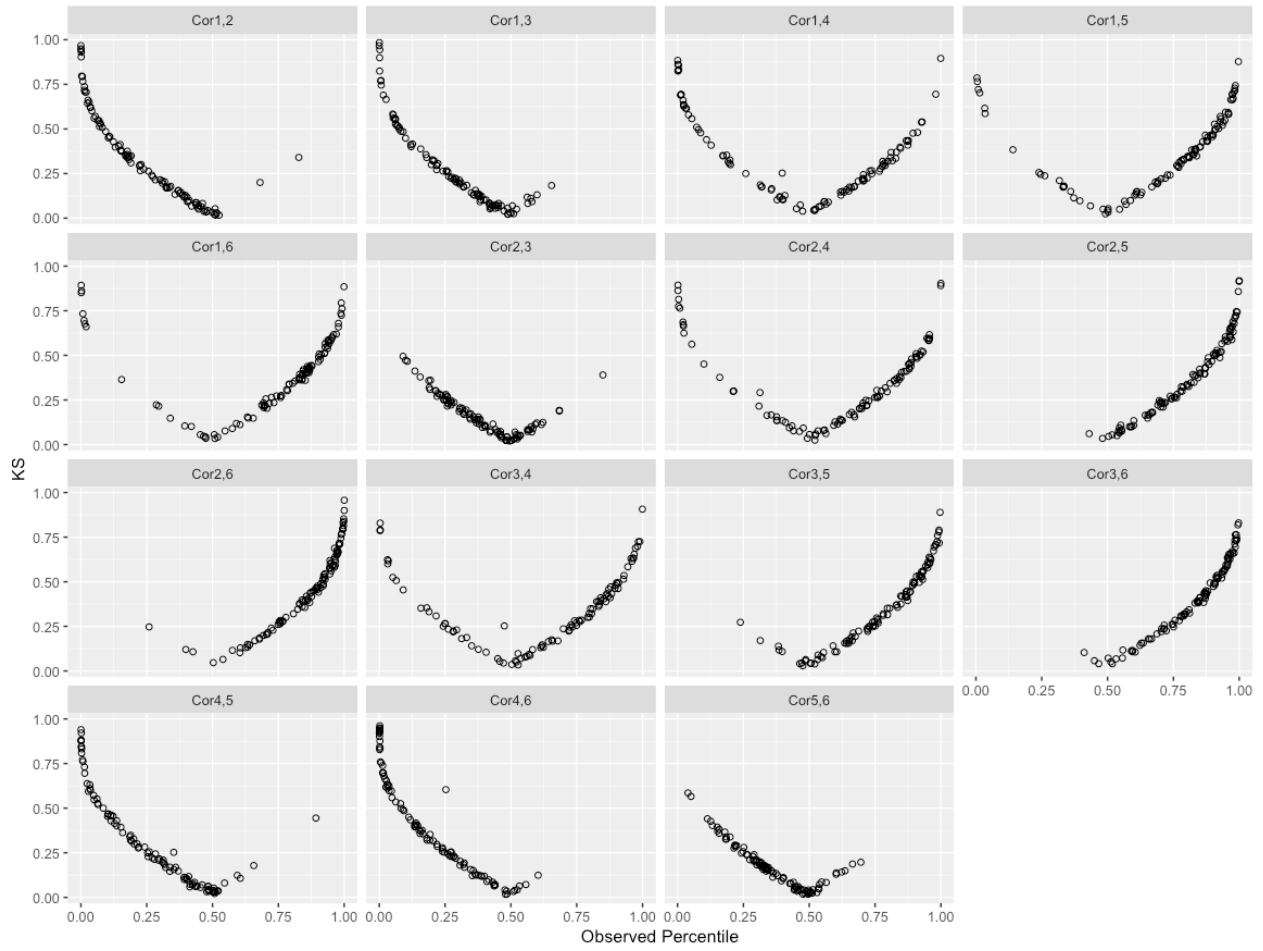

### PPP value for 2-factor (12-item test, N=500)

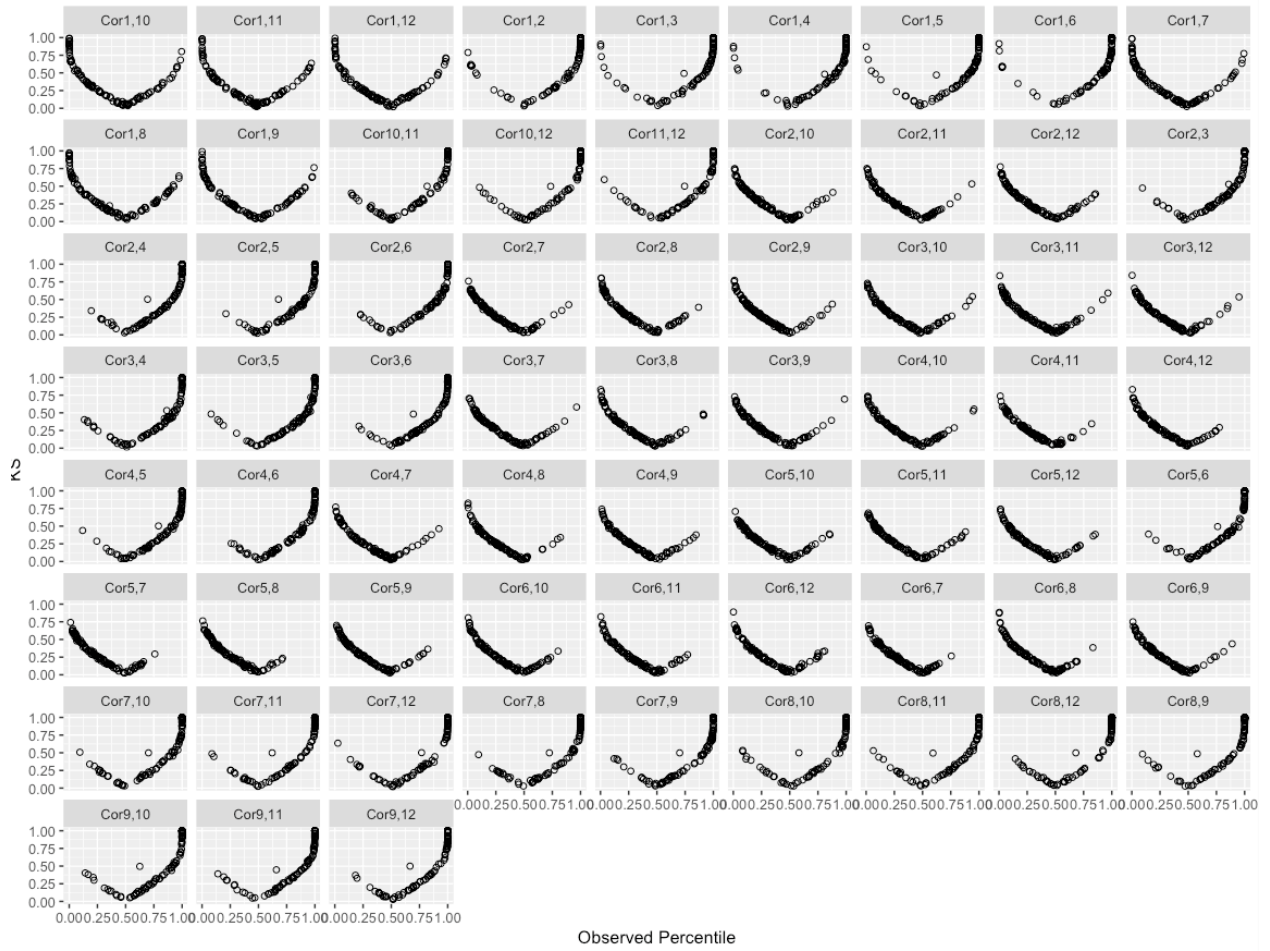

The pattern between KS and PPP values follow a “V” shape line.

overspecified-2factor\_500\_1\_6

underspecified-1factor\_500\_2\_6

### 3. Convergence Rate
